

Electric Process Heaters / Air Heaters

Complete electric process heaters in dead-leg-free versions, also known as electric heat exchangers, also belong to the **heatsystems** production program. An electric process heater is flanged into the flow pipe. The connection between the electric process heater and the flow pipe is dead-leg-free. The standard versions include TriClamp, BBS flange connections according to DIN and ANSI standards.

These medium-side connections are designed as TriClamps or according to customer request.

Different thermal insulation systems are available.

For clean rooms, **heatsystems** supplies gas-tight welded insulation.
